

ABSTRACT

A method and system of capturing Internet Web screens, while using a standard browser, is provided. Using a browser plugin, the history recorded by the browser itself is used to create a presentation. It permits a user to modify the order and content of the screens captured and to create a tailored presentation. All hyperlinks are preserved and the URL is added to each screen to enable the user to return to the Web page at any time . Presentations can be saved for archival purposes to document information gathered on the Internet, and can be shared over a network.
